Everyone with HIV needs to take HIV treatment – called antiretroviral therapy, ART or ARVs.
CAN POSITIVE PEOPLE HAVE HIV NEGATIVE CHILDREN?

YES!

ART protects your baby from HIV during pregnancy, birth and breastfeeding.

Talk to your nurse or doctor about it.
World Health Organization (WHO) guidelines now recommend ART for everyone with HIV, whatever their CD4 count or viral load. This includes pregnant women, adolescent girls and women who wish to get pregnant.

There are a few extra things for women and adolescent girls to consider when starting or taking ART.
Countries are changing first-line ART.

ART is usually three ARVs in one pill – called a fixed-dose combination.
For more information about TLD, read the “Starting ART” leaflet.

The new combination of ARVs will be: tenofovir, lamivudine and dolutegravir. This combination is sometimes called TLD.

The older first-line combination was based on a drug called efavirenz.
The new first-line combination is based on an ARV called dolutegravir.

There might be a slightly greater risk to an unborn baby whose mother falls pregnant while taking dolutegravir.
One study found a higher rate of neural tube defects than normal in babies whose mothers became pregnant on dolutegravir. Importantly, this was BEFORE the babies were conceived. Women who started dolutegravir after conception showed no problems. But, this was just from one study and might have happened by chance.
WHY IS A NEURAL TUBE DEFECT?

The neural tube in a developing baby is what becomes the brain, spinal cord, skull and spine. The neural tube closes in the first 28 days of pregnancy – that is before most women know they are pregnant. If it does not fully close for some reason, the baby is said to have a neural tube defect.
Neural tube defects vary, from very minor ones that are easily fixed, to ones that give severe disability and even death. So, the risk is taken very seriously by departments of health, health workers and patients.
CAN HIV POSITIVE WOMEN SAFELY TAKE DOLUTEGRAVIR?

*YES*

But with a few extra considerations.

*All HIV positive women should be told of their options to help them select the appropriate ARV combination with their health worker.*
If you have not yet started ART, and it is early in your pregnancy you will be recommended the efavirenz-based combination.

Later in pregnancy (usually after the first trimester) you will be recommended the dolutegravir-based one.
WHAT IF I DO NOT WANT TO FALL PREGNANT?

If you do not wish to become pregnant, and you are using effective contraception, you will be recommended the dolutegravir-based combination. Effective contraception means a modern method: condoms, pills, injectable, implant or sterilisation.

WHAT IF I WANT TO GET PREGNANT AND TAKE DOLUTEGRAVIR?

If you are aware of the risks and benefits, contraception should not be required for you to receive dolutegravir-based ART. Make sure you receive the counselling and information you need to make this decision.
MAKE SURE YOU ARE COMFORTABLE WITH YOUR DECISION

Planning a pregnancy is very similar whether or not you are HIV positive.

If you were only diagnosed with HIV during pregnancy, you might need lots of support beyond starting ART.
Your own health and your own HIV treatment are the most important things to consider for ensuring a healthy baby.
UNDERSTAND YOUR OPTIONS

Make sure you understand your options – including looking at information like this leaflet.

Make sure your health workers discuss your options with you and respect your decision.
